	Infant & child	MEDICAL	
Version date: 2023-08-05		Effective date: 2024-02-13 (0700)	

Manage airway & ventilation as required ☐ Minimize patient agitation ☐ Allow most comfortable position ☐ Provide supplemental blow-by O2 Yes Are there symptoms or signs Be prepared for complete suggesting epiglottitis, airway obstruction angioedema or FBAO? No No Are there signs of moderate or severe croup? Yes **PCP:** Consider epinephrine by nebulizer Yes Are there signs of impending Activate back-up and ALS respiratory failure? intercept if available No Transport **IDENTIFIER:** EMR: EMR PCP: PCP & ICP ICP: ICP only None - All providers

# QRG: NEBULIZED EPINEPHRINE (1 mg/ml) Dose: 0.5 ml/kg (up to max 5 ml) Add sterile saline up to 5 ml Nebulize over 15 min Repeat once in 2 hours if necessary This guide is for dosing only. Refer to the medication documents for additional information required for safe administration.

## **INDICATIONS**

Any infant or child with known or suspected croup

# **CONTRAINDICATIONS**

Stridor known or suspected to be due to epiglottitis, angioedema, or a foreign body airway obstruction (FBAO)

## **NOTES**

- 1. Croup is the clinical manifestation of viral laryngotracheobronchitis. It is uncommon over 6 years of age.
- 2. If there is any suspicion of epiglottitis (appendix A), angioedema, or foreign body airway obstruction (FBAO) minimize on-scene time and any unnecessary interventions, activate backup or ALS intercept if available, and transport emergently to the closest emergency department (ED).
- 3. In infants and small children, stridor and retractions may be minimal at rest but increased with exertion or agitation as increased airflow turbulence will worsen upper airway resistance.
  - Agitation may be minimized by having parents or caregivers assist in administering supplemental oxygen or medication using the blow-by technique.
- 4. **Croup symptoms and signs may decrease as airway obstruction worsens and airflow decreases.** Stridor may become less audible and retractions may decrease due to weakening of respiratory effort (appendix B).
  - Signs of *impending* respiratory failure include cyanosis or pallor and decreasing level of consciousness.
- 5. Mild croup responds well to the inhalation of cool or humidified air. If there are signs of moderate or severe croup, administer L-epinephrine.
- 6. During the COVID pandemic paramedics must wear extended personal protective equipment (PPE) when administering epinephrine by nebulizer. Although nebulization is an aerosol-generating medical procedure (AGMP) uncontrolled coughing by the child is a greater risk. COVID-19 and its

# **VERSION CHANGES (refer to X05 for change tracking)**

• Identifier legend at bottom of flow chart replaces work scope statement in header

APPENDIX A - CLINICAL DIFFERENTIATION OF CROUP FROM EPIGLOTTITIS							
	EPIGLOTTITIS	CROUP					
Age	Two years & older	Up to three years					
Onset	Usually sudden	Slower onset					
General appearance	Toxic / unwell	Relatively well					
Fever	High	Mild to moderate					
Cough and coryza	Minimal or absent	Usually present					
Stridor	Usually severe	Mild to moderate					
Speech	Muffled	Hoarse					
Secretions	Drooling, unable to swallow	Able to swallow					

APPENDIX B - CROUP SEVERITY <sup>2, 3, 4</sup>									
	LOC	cough	RESTING STRIDOR	AIR ENTRY	RETRACTIONS	CYANOSIS			
MILD	Normal	Occasional	None	Normal	None	None			
MODERATE	Normal	Frequent	Mild	Normal	Mild	None			
SEVERE	Agitated	Decreased	Severe	Decreased	Severe	None			
RESP FAILURE	Decreased	Decreased	Decreased	Decreased	Decreased	Present
